# Effect from imperfect information in different electricity market

Mid-term Presentation

Presenter:

Yue Wu

JHU AMS 2012 FALL

Last Complied on October 19, 2012

## **Outline**

Background

General Introduction

**Tools** 

Model Description

Deliverable

## **Basic Facts**

- In the electricity market, companies have to make decisions based on prediction of electricity demand and price
- No prediction is perfect. Companies will have to deal with imperfect information

Background General Introduction Tools Model Description Deliverab

# Different Kinds of Decision Making in Electricity Market

- Operations planning
  - Unit commitment
  - Maintenance and production scheduling
- Real time operations:
  - Dispatch
  - Automatic protection

## **Purpose**

 Purpose of this project is to find out how prediction accuracy affect companies' behavior and benefit in the electricity market. ackground General Introduction Tools Model Description Deliverab

## **Model Assumptions**

- Linearity
- Error distribution

## **Scenarios**

There are two scenarios to be discussed in the project:

- Single firm model
- Competitive market/optimal bidding model

## **Approach**

- For the single firm scenario, the problem will be set as a linear optimization problem with single objective function; a software solver such as excel solver or matlab will be used to solve the problem.
- For the optimal bidding scenario.the problem will be maximize the expected profit by hand.

ckground General Introduction Tools **Model Description** Deliverab

# **Single Firm Scenario**

- Market(competitor)
- Demand
- Price
- Utility

ackground General Introduction Tools Model Description Deliverabl

## Single Firm Scenario

#### Objective:

• Minimize operation cost

#### Decision variables:

- Which unit/units to be used for the moment
- What kind of fuel or technology to generate from for the particular moment

ckground General Introduction Tools **Model Description** Deliverabl

# Single Firm Scenario

#### Constraints:

- Capacity
- Demand
- Environmental regulations
- Ramp
- Reserved capacity

ckground General Introduction Tools **Model Description** Deliverabl

# **Optimal Bidding Scenario**

- Market(competitor)
- Demand
- Price
- Bidding System

ckground General Introduction Tools **Model Description** Deliverable

# **Optimal Bidding Scenario**

#### Objective:

• Maximize expected profit

#### Decision variables:

- Bid quantity
- Bid price

#### Information:

- Prediction of price
- Error distribution of prediction
- Effective demand curve (optional)

ackground General Introduction Tools Model Description Deliverabl

# **Optimal Bidding Scenario**

#### Constraint:

Bidding cap

#### Different situation:

- No market power
  - Market clearing price system
  - Pay as bid
- With elastic demand

ckground General Introduction Tools Model Description Deliverable

## **Project Output**

The following outputs are expected from this project:

- List of economics results under different scenarios of different prediction accuracy,
- Mathematical description of market models, including data and equations,
- Spreadsheet of Excel showing details of how the model is structured and solved,
- Technical report and presentations summarizing the work.
